EDUCATION

M.S. in Computer Science (3.8/4)

Portland State University

2018 – Present

Post-bacc in Computer Science (3.33/4)

Portland State University

2017 – 2018

Computer Science (Transfer)

Portland Community College

2016 – 2018

MBA in Finance

Regional College of Management

2011 – 2013

Bhubaneswar, India

WORK EXPERIENCE

IOTG Profit Optimization Intern

Intel Corporation

June 2019 - Present

Chandler, AZ

- Collaborate with multiple teams (OM Task Force, IOTG-Finance, SMG) for data collection, analysis, modeling & visualization.
- Built real-time dashboard for tracking year-round IOTG Operating Margin.
- Built interactive team website with one stop project management repository using SharePoint, HTML, CSS and JavaScript.
- Built executive view dashboard with SKU level margin tool for SMG team to set margin goals and allow comparable margin visibility.

HR Executive-US Payroll

HSBC Electronic Data Processing India Private Limited

2014 - 2015

Hyderabad, India

BusinessDevelopmentOfficer-ModernTrade

Parle Agro India Private Limited

2013

Bhubaneswar, India

TECHNICAL SKILLS

Linux, C, C++, Python, Flask, AWS, Google Cloud Platform, Docker, GIT, Bitbucket, Java, JUnit Testing, MongoDB, SQL, Google Web Toolkit, JSP, Servlet, REST API, Android, HTML, CSS, Javascript, SharePoint, Power BI, C#, .NET

BUSINESS SKILLS

Ratio Analysis, Cash Flow Management, Security Analysis, Capital Budgeting, Trading & P/L, Balance Sheet Reports.

TECHNICAL COURSE WORK

Full-Stack Web Development, Internet and cloud Systems, Cloud & Cluster database, Java Programming, Data Structure, Operating Systems, Linux, Software Engineering, Computational Photography, Algorithm, Database Management System, etc.

BUSINESS COURSE WORK

Quantitative Techniques, Financial Services, Security Analysis, Capital Budgeting, Financial Planning and Wealth Management, etc.

ACADEMIC PROJECTS

Instapix: (Flask, SQL, GCP): Designed and developed a Google cloud based application to allow users to follow other users, share/comment/like posts/photos, and view timeline etc.

Bubble Tea: (Flask, SQL, GCP): Designed and developed a Google cloud based application to allow users to add different Bubble Tea store details (name, location, hours, contact, drinks, etc.) and give reviews.

Operating Systems Projects: XV6(C, UNIX)

- System calls: implemented a new system calls for date and time.
- Process: implemented system calls to support and obtain process ownership, set and extract UID, GID, PID, track amount of time a process uses CPU.
- Shell: create new user command('ps' and 'ctrl+p' command), extract process detailed information. Scheduling: implemented MLFQ scheduler.
- File system: implemented chmod, chown, chgrp system calls to set and modify file permissions that persist across xv6 sessions. Modified 'exec' and 'ls' command to enforce and display new file permissions respectively.

Buddy System(C): Implemented a module that imitate malloc and free to manage a block of memory(e.g. heap) using buddy system.

Twitter(Java): An application which emulates the Twitter. Given a set of tweets as input, it extracts information such as date and time, user, tags, keywords, etc. and categorizes the tweets based on it.

Chat Application(Java): A Text-based messaging application using Java swing for designing GUI, HTML for aligned display of messages, Java socket for client-server communication, MongoDB to persist users information.

Phone Bill Web Application(Java, GWT): Multi-phased web application that maintains the phone call record details. Features implemented are: display a README manual describing how the program works, adding a new call record, display details of all calls or calls recorded within a certain period of time.

Computational Photography Projects (C++): Image processing

Toonify - gives a cartoon like effect to images. Emulated cel-shading effects by applying median filter, canny edge detection, morphological operation, edge filtering and bilateral filter.

Mosaic - gives a tiling effect, implemented by splitting the image to tiles, then averaging the color values and replacing each tile with a matching image.

Circle Packing - gives the effect of cluster of circles by storing all the pixel values to fill the the circles and compare the (x, y) position within the image bounds to prevent overlapping of circles.

Hangman(Android): Developed a word guessing game given a limited number of wrong guesses. It selects and sets a random word from a text file and asks the user to guess the letters. Displays letters or next hanging picture on every correct or wrong guess respectively. The user loses once the hangman picture is complete.

Data Structure Projects(Java and C++):

Multi-chained linked list: Implemented a linked list from scratch with three separate link chains to keep the data entries unique and sorted by three different fields.

Tree:

Binary Tree: Implemented binary tree from scratch to store and retrieve data of plants reproduced by experimentation and categorized by their generation.

AVL Tree: Implemented set container like in STL using AVL tree that supports union, intersection, cross product, and power set operations.

Hash Table: Implemented hash table from scratch to store family (key) and their friends (value).

Algorithms Projects(C++):

Sorting Algorithms: implemented and analyzed various sorting algorithm using random data set.

Graph Algorithm: Implemented and analyzed Kruskal's and Prim's method of finding the Minimum Spanning Tree on random graphs, using union find data structure.

Shaunting Yard: Implemented Dijkstra's shaunting yard algorithm using stack to evaluate logical expressions with AND, OR, NOT, etc. based on their order of precedence.
